1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

Input Format

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

Output Format

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

Answer

```
// You are using Java
import java.util.*;
public class Main{
    public static void main(String[]args){
        Scanner s= new Scanner(System.in);
        int a=s.nextInt();
        int b=s.nextInt();
        int [][]a1=new int[a][b];
        int [][]a2=new int[a][b];
        int [][]a3=new int[a][b];
        for(int i=0;i<a;i++){
            for(int j=0;j<b;j++){
                a1[i][j]=s.nextInt();
